

DiniTech GmbH, The Mobility House and AMAG start cooperation in Switzerland

The mobile charging solution - NRGkick - from DiniTech is also convincing in Switzerland. After joint discussions, together with the already long-standing partner, The Mobility House, the cooperation with the largest automotive company in Switzerland is now perfect. From now on, the AMAG Group will also use NRGkick as the flexible wallbox.

NRGkick is already available in the second product generation since May 2022. The full-fledged flexible wallbox for e-vehicles is produced from the idea and product development, to the completion of the final product in the new, high-quality competence center in St. Stefan im Rosental, in Austria. Many clever minds are working together to make this possible. After all, NRGkick is not just a "simple charging cable" whose purpose is defined purely by charging a vehicle. The unit has numerous intelligent functions that simplify the lives of e-car drivers and fleet managers. Via WiFi and Bluetooth, optionally even an integrated SIM, as well as the NRGkick app and cloud, numerous settings can be changed at any time and from anywhere. In addition, detailed information on all charging processes and detailed charging records are thus available at any time.

The Swiss market is already very well covered thanks to the long-standing cooperation with [The Mobility House](#), the expert for intelligent charging and energy solutions. Thanks to the partnership with The Mobility House, AMAG Group AG has become an important customer, opening up new opportunities. "The talks on site were very good and I am absolutely proud that we have a strong partner in AMAG Group AG, who is backing NRGkick, and that we are thus making further progress in the Swiss market," says CEO of DiniTech Dietmar Niederl.

In addition to intelligence, the main focus of NRGkick is on safety - the unit is not described as the "safest charging solution on the market" for nothing. This promise is implemented in the form of various safety mechanisms. For example, each smart attachment of the worldwide unique, patented safety smart attachment system has temperature monitoring - again at each individual phase pin! This system not only enables charging at any available socket as well as at public charging stations, but also excludes overheating or scorching of the sockets. Other examples of the numerous safety features include integrated overvoltage protection, autonomous load management, and automatic unplug detection, which reliably prevents dangerous arcing if the charging unit is accidentally disconnected during charging. So with all its features, NRGkick is more than safe - removing any cause of concern for users.

Together with DiniTech and NRGkick, the AMAG Group is thus sending out a strong signal for safety and quality. When it comes to charging electric vehicles, it is essential that the charging equipment also meets the highest requirements.
